

## Three Nooks Farm Update – 31<sup>st</sup> January 2014

The well test operations have been underway at Nooks Farm this week, we are flaring gas from the well and taking pressure and flow measurements in order to assess whether there is sufficient gas available to make the power generation project commercially viable.

The flaring operations commenced on Tuesday morning and were scheduled to take place over 4 consecutive days, unfortunately weather conditions on Wednesday, specifically a change in the wind direction, meant that it was unsafe to operate and so the fourth day will now be Saturday. We will be flaring between 7am through to 6pm. The flaring will finish on Saturday late afternoon.

On Sunday we will dismantle the equipment and it will be despatched from site over Monday and Tuesday.

The vehicle movements will be the same as before, 5-6 over the two days avoiding the school drop off periods.

We will then be back on site for one more day in around 10 days time in order to remove some gauges from the well that have been left recording pressures.
